

# Wiring and routing within enclosures and electrical buildings

Evaluate how tray, cable entries and internal connections could be planned and supplied together for an enclosure or building.

## APPLICATIONS TO EVALUATE

- 1 Tray routing and segregation**

Power and control cables run in separate tray or channel, with routes defined before assembly.
- 2 Cable entries and transits**

Entry plates and transits matched to the cable counts and sizes in the design, with spare capacity agreed up front.
- 3 Internal equipment connections**

Equipment drops prepared to length and identified to the connection list, so each landing can be checked against the drawing.

**Established: Southwire wire and cable manufacturing and supply.**

For evaluation: the prepared kits, cable packages and assemblies shown are application concepts, not qualified Southwire products.

Illustrative model. Ratings, cable sizes, clearances and termination selections are subject to application engineering. No code compliance, engineering approval or certification is implied.

## PROPOSED NEXT STEP

Select one enclosure or building application and define assembly ownership for tray, entries and internal cabling.
