

Evaluating repetitive wire preparation in production

Compare in-house cut, strip, ferrule and marking steps with conductors that arrive prepared for the terminals you use.

APPLICATIONS TO EVALUATE

- | | | |
|--|--|---|
| <p>1 Identification at both ends</p> <p>Markers printed to the wire list so each conductor can be checked against the schedule at installation.</p> | <p>2 Prepared ends for terminal blocks</p> <p>Strip lengths and ferrules selected for the terminal types used, subject to your termination standards.</p> | <p>3 Lengths set by duct routing</p> <p>Lengths based on the routing through wire duct, keeping installation consistent from build to build.</p> |
|--|--|---|

Established: Southwire wire and cable manufacturing and supply.

For evaluation: the prepared kits, cable packages and assemblies shown are application concepts, not qualified Southwire products.

Illustrative model. Ratings, cable sizes, clearances and termination selections are subject to application engineering. No code compliance, engineering approval or certification is implied.

PROPOSED NEXT STEP

Compare current preparation steps with a proposed kit for one compartment, using the same wiring schedule and terminal set.
